0.0	6.6	OVERBURDEN					
6.6	10.4	METASEDIMENTS Colour: light green to medium grey; white Hardness: 2 to 7 Composition: 30% quartz, 10% garnet, 60% altered mafics, minor sulphides Finely bedded metasediments. Beds consist of garnet-rich bands with a matrix of fine-grained dark green chlorite (+ pale yellow amphibole needles) alternating with bands of lighter green chloritized iron-rich mafics and white quartz beds. Garnetiferous bands to 5cm wide with euhedral red garnets to 2mm across. Minor stretching of garnets parallel foliation seen locally. Mafic bands are aphanitic to fine-grained and consist of amphiboles, micas and chlorites. Garnet bands throughout sequence; consist of pure white quartz with minor interstitial chlorite or amphibole. Sulphides rare in quartz (to 1% locally, pyrrhotite and minor pyrite). Unit is non-magnetic to approximately 8.5m and competent throughout as only minor fractures crosscut the bedding. Bedding oriented at 60° to 65° to the core axis. At 8.1m, minor dark blue copper stain on fracture surface.	6.6	8.5	1.9	1151A	NIL (16 ppm As)
			8.5	10.4	1.9	1152A	NIL (7 ppm As)
			6.6	14.3	7.7	13151	(sludge) 20
10.4	19.8	BANDED IRON FORMATION - OXIDE FACIES Colour: light grey to off-white overall Hardness: 2 to 7 Composition: 50% quartz, 25% altered mafics, 18% magnetite, 5% garnet, 2% sulphides. Alternate whitish to light grey bands throughout. White quartz bands with grey colouration due to increased magnetite (+ altered mafic) content. Magnetite throughout; magnetite concentrated in grey bands of quartz.	10.4	13.4	3.0	1153A	NIL (24 ppm As)
			14.3	19.2	5.1	13152	(sludge) 30

METRES		DESCRIPTION	CORE SAMPLES				
FROM	TO		FROM	TO	WIDTH	Samp	Gold (ppb)
		Bedding at 65° to core axis. Unit competent throughout with minor fractures at 40° to core axis and crosscutting the bedding. Minor concentrations of green chlorite and yellowish amphibole locally; associated with partially altered garnets. At 10.8m, fracture with rusty brown calcite crystals (1mm wide). Sulphides disseminated throughout quartz-rich zones, but locally concentrated. Rarely occur as blebs or along fractures crosscutting bedding. Predominantly pyrrhotite plus pyrite; minor chalcopyrite and copper stain locally. At 11.3m, 2 bands to 5mm across containing quartz grains with up to 20% interstitial pyrrhotite with 5% chalcopyrite concentrated along edges. At 14.7m, 1mm wide fracture; possibly filled with magnetite and oriented at 30° to core axis. At 15.0m, 2mm wide vein of pyrrhotite (chalcopyrite minor). Beds of quartz now fractured (sub-parallel core axis) with fractures resealed with pyrrhotite. From 14.7 to 15.2m - sulphide-rich zone. Bedding consistent at 60-65° to core axis. Beds of uniform width across core and up to 1cm wide. Unit strongly magnetic throughout with minor local variations. Sulphide content also varies over short distances. At 15.6 to 15.8m, dark band of very fine-grained magnetite; bedding poorly preserved; only minor impurities present. At 15.9m, a 1cm bed of green chlorite and relict garnets. At 16.8m, a significant decrease in volume of drill return. At 17.4 to 17.5m, magnetite-rich zone; beds of relict garnets present. At 19.1m, a small fracture at 30° to core axis.					
			13.4	16.6	3.2	1154A	NIL (19 ppm As)
			16.6	19.8	3.2	1155A	10 (53 ppm As)
19.8	21.8	<u>SULPHIDE FACIES IRON FORMATION</u> Colour: Dark grey Hardness: 3 to 4 Composition: 30% sulphides (pyrrhotite and pyrite), 20% quartz, 40% argillaceous material and 10% garnets (and alteration products).					
		Bedding at 70° to core axis. Beds to 1cm thick of pyrrhotite (+ pyrite) alternating with quartz-rich bands, garnet-rich bands and dark grey, very fine-grained argillaceous material. Moderately magnetic due to pyrrhotite content; sulphide bands very magnetic. Irregular blebs of white calcite associated with garnetiferous beds. Quartz beds fractured sub-parallel to core axis where 1cm wide and more. Contact with above unit gradational over 15cm.	19.8	21.8	2.0	1156A	20 (45 ppm As)
			19.2	26.2	7.0	13153	(sludge) 30

METRES		DESCRIPTION	CORE SAMPLES				
FROM	TO		FROM	TO	WIDTH	Samp.	Gold (ppb)
21.8	27.6	<p><u>OXIDE FACIES IRON FORMATION</u> Similar to interval 10.4-19.8m; sulphide content increased to 10% locally. At 23.6m, a 15mm wide pyrrhotite band; 75% sulphide. At 23.9-24.0m, numerous narrow (2-3mm) wide bands of pyrrhotite; quartzite-rich zones bordering zone cut by sulphide-filled fractures parallel to core axis. At 25.1 to 25.2m, moderate folding, fracturing present; quartz clasts in sulphide matrix; minor (less than 1mm) offsets along some fractures. At 25.5m, 15mm band of pyrrhotite. At 25.7 to 25.8m, similar to interval 25.1-25.2m. At 25.1-27.5m, sulphide content averages 10% to 15% throughout this zone; still strongly magnetic throughout.</p>	21.8	24.7	2.9	1157A	10 (23 ppm As)
			24.7	27.6	2.9	1158A	NIL (7 ppm As)
27.6	31.6	<p><u>FELSIC TUFF</u> Colour: light grey, uniform throughout Hardness: 3 to 7 Composition: crystal fragments 30% of rock (80% feldspar/20% quartz); matrix 60% of rock; micaceous bands 10%. Unit consists of anhedral to rarely euhedral crystal fragments of feldspars and minor quartz (to 5mm in size). Matrix very fine-grained to aphanitic; felsic in composition. Non-magnetic; massive throughout. Few sulphides visible (less than 1% overall); minor chalcopyrite texture to rock at approximately 65° to the core axis. Locally, bands of light green micaceous, chloritic material are found at an angle of 65° to the core axis. Upper and lower contacts gradational over about 5cm.</p>	27.6	29.6	2.0	1159A	NIL (41 ppm As)

35.1	38.4	<p><u>BANDED IRON FORMATION - OXIDE FACIES</u> Similar to interval 31.6-32.5m. Extremely well banded; alternating light grey quartz-rich beds and dark magnetite-rich beds. Minor (less than 2%) sulphides locally.</p>	32.3	38.4	6.1	1315A	70/40 (sludge)
			35.1	38.4	2.7	1163A	60/40 (7 ppm As)
38.4	40.5	<p><u>FELSIC TUFF</u> Similar to interval 32.5-35.1m.</p>	38.4	40.5	2.1	1164A	NIL (3 ppm As)
40.5	92.9	<p><u>BANDED IRON FORMATION - OXIDE FACIES</u> Similar to interval 35.1-38.4m. Distinct and alternating beds of quartz-rich, magnetite-rich and fine-grained amphibole; some sulphides (less than 2%) associated with amphibole beds; minor magnetite also; size and concentration of beds varies locally. At 43.9m, lost all return. At 44.2m calcite veinlet oriented at 30° to core axis. At 44.2-44.4m, numerous beds rich in pyrrhotite (to 60%). At 46.9-47.6m, band of fine-grained, radiating amphiboles with 15% relict garnets. At 48.5m, small (less than 2mm) fractures infilled with calcite oriented at 30° to core axis. At 54.3-54.7m, zone of veining and minor faulting; veins to 5mm wide oriented subparallel core axis; vein material consists of calcite or quartz plus chloritized fragments; fragments in both vein types angular; minor (less than 1cm) offsets in bedding visible along fractures. At 55.2m, a small (2mm) wide calcite fracture at 50° to core axis. At 55.8-55.9m, a zone of fracturing and minor brecciation; introduction of calcite and minor sulphides. At 56.7m, a 2mm wide fracture at 30° to core axis; infilled with calcite and magnetite; bordered by pyrrhotite. At 58.1m minor graphite on small fracture surface. At 58.2m, minor contortions in quartz bedding over 5cm width. At 62.1m, a 1cm wide sulphide-rich bed (to 60% pyrrhotite). At 63.0m, bedding at 65° to core axis. At 67.4-67.7m, bedding contorted and near-parallel to core axis over this interval; no associated faulting or veining. Relatively little sulphide in this unit compared to similar units above. Increase in number and width (to 15mm) of amphibole-rich beds; magnetite concentrated in these beds when disseminated through unit; occurs as small (less than 1mm) crystals, locally concentrated into microbeds. At 78.9-80.5m, quartz-rich zone; sulphide concentration 5%, to 10% locally; pyrrhotite only sulphide visible; occurs as blebs</p>	40.5	43.5	3.0	1165A	NIL (16 ppm As)

92.9	129.5	VOLCANIC TUFF Colour: light green overall; interbedded green and light green to white beds. Hardness: 2 to 7 Composition: 50% amphibole, 35% quartz (plus minor feldspar), 10% chlorite and 1-2% sulphides. Unit consists of alternating felsic (predominantly quartz) and mafic (predominantly) layers. Layers from less than 1mm to 3mm in width, oriented at 60° to core axis. Rock is fine-grained overall; clusters of radiating amphibole crystals throughout; locally, relict amphibole crystals to 3mm across; concentrated in layers, moderately chloritized; elongate parallel layering. Sulphides consist of very fine-grained iron sulphides; minor chalcocopyrite; pyrrhotite predominates as there is a weak magnetic response where concentrated in felsic layers; layers consistent and undisturbed; rock massive; minor fracturing. At 99.8m, quartz veinlets 1mm wide subparallel to core axis. At 103.6m, quartz band 5cm across. At 105.4-106.1m, sulphide concentration to 15% overall in this zone; pyrrhotite predominantly; otherwise, similar to rest of unit; concentrated in beds parallel to rest of unit. At 106.9-107.3m, same as above. At 108.7m, 5cm wide zone similar to interval 106.4-107.1m. Below approximately 113.0m, quartz-rich bands decrease in size and number; rock more massive with irregular quartz bands and	92.9	96.0	3.1	1182A	NIL (61 ppm As)

METRES		DESCRIPTION	CORE SAMPLES				
FROM	TO		FROM	TO	REMARKS	ANALYSIS	
0.0	6.8	OVERBURDEN					
6.8	70.4	VOLCANIC TUFF Colour: light to medium green overall; alternating green and whitish layers on small scale. Hardness: 2 to 7 Composition: highly variable on small scale due to layering; 40% felsic material (65:35 quartz: feldspar ratio), 40% amphibole, 10% chlorite; 5% biotite; 5% sulphides (predominantly pyrrhotite). Rock is fine-grained throughout (less than 1mm) and finely banded in most areas; banding width to 2-3mm; oriented at 60° to the core axis; bands are alternately felsic and mafic-rich. Alignment of mafic minerals gives rough foliation to unit. Bands of uniform orientation throughout and uniform width locally (may be primary bedding). Sulphide content 5% or less throughout unit, but to 10-15% locally; more concentrated in felsic zones; pyrrhotite predominates sulphides and results in weak magnetic response where concentrated; euhedral pyrite crystals to 3mm seen locally in pyrrhotite blebs; minor chalcopyrite; sulphide concentrations are irregular in shape but parallel local banding. Overall, unit is massive with only minor fracturing visible. At 6.9-7.3m, sulphide-rich felsic zone. At 7.7m, a 1cm wide biotite band, oriented at 60° to core axis. At 7.8m, calcite bands (less than 2mm wide). At 10.1-11.4m, fractures subparallel core; contain chlorite and minor calcite. At 12.1m, pyrrhotite-filled fracture; 1mm wide; 10° to core axis and crosscutting banding. At 12.4-12.5m, 1mm wide quartz-pyrrhotite veins (+minor calcite) at 25° to core axis. Chlorite and minor calcite on fracture

FROM	TO		FROM	TO	WIDTH	Samp.	Gold (ppb)
		surfaces; crosscut banding at 50° to core axis. At 14.0-14.4m, moderate calcite veining in this interval; veins randomly oriented and to 4mm across; minor offsets (2mm) of banding along some fractures. At 17.9m, quartz lens with euhedral pyrrhotite grains and minor chalcopyrite. At 18.0-18.1m, 3cm wide quartz vein crosscutting banding; oriented at 40° to core axis. At 21.4-21.5m, quartz vein perpendicular to core axis; irregular contacts; pyrrhotite and pyrite concentrated in host tuff at contact; amphiboles to 5mm near contact; pyrite on numerous fracture surfaces that randomly crosscut core. At 22.3-22.9m, quartz vein similar to interval 21.4-21.5m. At 25.1m, euhedral garnets to 2mm across. At 26.2-32.7m, felsic content increases to approximately 60%, resulting in lighter colour through this area; 26.4-26.9m, sulphide content averages 10-15%; consists of 60% pyrrhotite and 40% pyrite; sulphides occur as bands and as blebs crosscutting banding; gradational contacts with more mafic phases above and below; at 31.6-32.7, sulphide-rich zone similar to interval 26.4-26.9m.; pyrrhotite content results in these intervals being moderately magnetic. At 34.0-35.3m, agglomeratic zone; fragments of tuffaceous material to 4cm on long axis in matrix of volcanic tuff; fragments more felsic than matrix; to 60% quartz and feldspar; subhedral to anhedral in shape; strongly corroded rims; elongate subparallel banding; banding often disturbed to 5mm above and below fragments. At 37.6m, calcite veinlets (1mm wide) subparallel to core axis. At 36.9-39.1m, similar to interval 34.0-35.3m. At 39.2-41.2m, sulphide-rich zone; 15% sulphides locally; predominantly pyrrhotite; unit slightly magnetic; sulphides in bands, randomly oriented blebs and disseminated throughout zone. At 39.2-48.1m, more felsic interval similar to 26.2-32.7m; 44.5-44.6m, quartz vein oriented near perpendicular to core axis; to 5% pyrite:pyrrhotite locally on fracture surfaces. At 49.5-52.2m, sulphide-rich zone similar to interval 39.2-41.2m; 49.7m - quartz vein 5cm across; 90° to core axis, irregular contact; at 50.1m, 2cm wide sulphide band; to 20% sulphides here. At 53.8-54.1m, sulphide-rich zone; sulphides in bands oriented at 60° to core axis; to 10% sulphides locally. At 58.2-61.5m, agglomeratic zone, similar to interval 34.0-35.3m; fewer fragments visible, more mafic in composition. At 67.5-67.6m, pegmatitic zone;	24.8	27.8	3.0	L200A	NIL

METRES		DESCRIPTION	CORE SAMPLES				
FROM	TO		FROM	TO	WIDTH	Samp.	Gold (ppb)
0.0	8.8	OVERBURDEN					
8.8	68.9	TUFFACEOUS METASEDIMENT					
		Colour: medium green overall; alternating green and light green to white bands on small scale.	8.8	11.8	3.0	1216A	NIL
		Hardness: 3 to 7					
		Texture: alignment of mafic minerals produces a foliation parallel banding (original bedding?) in rock; oriented at 60° to core axis.	11.8	14.8	3.0	1217A	NIL
		Composition: highly variable with respect to individual beds; overall composition as follows: felsics 50% (80% quartz; 20% feldspar), mafics 45% (60% amphibole, 30% biotite, 10% chlorite) and 5% opaques (magnetite, iron sulphides).	9.5	16.8	7.3	13160	NIL (sludge)
		Overall, very fine-grained. Rock consists of alternating bands of mafic-rich and felsic-rich material oriented at 60° to core axis; banding very regular and consistent across the core and throughout its length, with only local variations; banding likely relict bedding. Width of individual beds less than 2mm. Rock is very weakly magnetic throughout; anhedral opaque crystals thus likely magnetite; such crystals are more common in mafic beds. Minor sulphides visible locally; pyrrhotite and pyrite. At 10.0m, euhedral red garnet to 15mm across. At 12.2m, quartz veinlets to 2mm wide crosscutting bedding at 50° to core axis. At 12.9m, calcite veining over 3cm length of core; veins oriented subparallel bedding. At 14.2m, minor fracture at 20° to core axis; pyrrhotite visible on fracture surface. At 14.4m, 4cm wide zone of 5% sulphides; pyrrhotite predominates; rare chalcopyrite visible. At 14.7m, 1cm wide quartz-calcite vein; near perpendicular to core axis. At 16.5m, fracture at 60° to	14.8	17.8	3.0	1218A	10

		core axis; crosscuts bedding. Sulphides most often associated with or bordering felsic beds. At 18.0m, minor fracturing near parallel core axis; fractures chloritized and completely rehealed; minor pyrrhotite on fracture surfaces. At 18.2m, offset of 3-4mm along one fracture/fault surface; oriented at 15° to core axis. At 21.8-21.9m, felsic-rich bed; minor mafics; contains 15-20% pyrrhotite; pyrrhotite occurs as irregular blebs and smeared along bedding surfaces; bedding partially disrupted in this interval; outer contacts have sutured appearance; minor fracture crosscuts zone; oriented at 60° to core axis. At 23.5m, 2cm wide quartz vein at 40° to core axis; sharp contacts with host rock; moderately fractured; minor iron sulphides visible. At 26.5m, lost water return. At 26.7m, quartz bed with 15% pyrrhotite; bedding at 70° to core axis. At 30.6-33.0m, sulphide-rich zone; pyrrhotite content 5-10% throughout; to 20% locally; concentrated in beds to 1mm wide; to 50% concentration in such beds; bedding at 60° to core axis; very minor sulphides disseminated throughout mafic-rich beds; sulphides predominantly within or at borders of felsic beds. At 32.3-32.7m, zone of fracturing and minor brecciation; some offset across fracture zone; fractures crosscut bedding; oriented 30° to core axis; infilled with pyrrhotite; entire zone slightly magnetic; gradational contacts with unit above and below. 33.4-34.9m, biotite-rich zone; brown beds of biotite alternate with greenish mafic beds; minor felsics throughout. At 34.9-38.1m, tuffaceous sediment with 5% pyrrhotite disseminated throughout. At 38.1-41.0m, 10% sulphides in this interval overall; minor disseminated sulphides as in previous interval as well as sulphide-rich beds (30% sulphides) to 1cm wide locally; pyrrhotite predominates, minor pyrite locally; similar to interval 30.5-33.0m; 1cm wide vuggy zones at 39.2, 39.5 and 40.8m; 5mm offset of bedding at 40.8m along small rehealed fault plane. At 41.0-42.3m, major sulphide-rich zone; sulphide content to 35% overall and 50-60% over short intervals; pyrrhotite and pyrite disseminated throughout but majority concentrated in beds to 5cm across (to 60% by volume in such beds); unit moderately to strongly magnetic; pyrite often concentrated in blebs within pyrrhotite zones; bedding disrupted where sulphides concentrated. At 42.1-42.3m, zone of brecciation with felsic clasts in matrix of	45.3	48.3	3.0	1230A	NIL

METRES		DESCRIPTION	CORE SAMPLES			
FROM	TO		FROM	TO	WIDTH	Samp Gold (ppb)
0.0	9.1	OVERBURDEN				
9.1	33.8	<p><u>TUFFACEOUS METASEDIMENTS</u> Colour: pale green to off-white Hardness: 2 to 7 Texture: well bedded; alignment of mafic minerals results in foliation parallel bedding; oriented at 60° to the core axis. Composition: composition of individual beds highly variable; overall composition: 60% felsics (40% quartz; 60% alteration products); 30% mafics (50% amphibole; 30% mica; 20% chlorite); 5-10% garnet; and 2-5% sulphides (80% pyrrhotite; 20% pyrite; trace chalcopyrite). Well bedded tuffaceous metasediments. Bedding oriented at 60-65° to the core axis. Finely bedded; beds to 5mm wide locally. Minor sulphides disseminated throughout; in felsic beds where concentrated. Unit non-magnetic. Subhedral to anhedral (corroded) garnets locally; concentrated near mafic zones; to 1cm along long axis; some elongation parallel bedding. Minor fracturing; limonite staining on fracture surfaces near top of unit. Light coloured felsic beds consist largely of aphanitic alteration products; soft and talc-like in appearance. At 10.3m, minor fracture at 10° to core axis. At 16.5 to 20.5m, talc-like alteration products concentrated in better defined beds; little primary mineral remaining. At 19.1m, fracture at 30° to core axis; crosscuts bedding. At 19.2m, 2cm wide quartz vein near parallel bedding. Only small (to 3mm) isolated garnets below; approximately 20.0m. Below approximately 29.0m, sulphide content increases slightly; concentrations of to 10% sulphides in</p>

METRES		DESCRIPTION	CORE SAMPLES				
FROM	TO		FROM	TO	WIDTH	Samp	Gold (ppb)
		beds to 1cm wide found locally. At 31.1 to 31.7m, numerous fractures subparallel to core axis. At 31.8m, 10cm of broken cc.e. At 33.4 to 33.8m, minor fracturing; randomly oriented; small vugs (1mm) associated with fractures					
33.8	37.8	<p>TRANSITION ZONE</p> <p>Consists of interbanded oxide facies iron formation, sulphide zones and tuffaceous metasediments. Contacts often distinct. Iron formation strongly magnetic, sulphide zones moderately magnetic due to pyrrhotite (and magnetite) concentrations and tuffaceous metasediments are essentially non-magnetic. Bedding, where preserved, is at 60° to the core axis. Zones of tuffaceous metasediments are identical to those described above; garnets to 1cm on long axis. Oxide facies iron formation identical to that found below; to 20% sulphides locally. Sulphide-rich zones consist of 80-95% sulphides with rounded fragments of mafic and felsic material contained within; fine-grained; consists of 70% pyrrhotite, 30% pyrite and trace chalcopyrite.</p> <p>33.80-33.95m - iron formation 33.95-34.35m - sulphide zone 34.35-34.65m - iron formation 34.65-35.40m - tuffaceous metasediment 35.40-35.60m - iron formation 35.60-35.95m - sulphide zone 35.95-36.40m - iron formation 36.40-37.05m - tuffaceous sediment 37.05-37.45m - iron formation 37.45-37.80m - tuffaceous metasediment</p>					
37.8	40.8	<p>FELSIC TUFF</p> <p>Colour: off-white to light grey Hardness: 3 to 7 Composition: 60% quartz; 35% feldspars; 5% mafics; trace magnetite</p> <p>Unit consists of fine-grained felsic groundmass with feldspar phenocrysts (to 3mm wide) within it. Mafics aligned at 65° to core axis; subparallel bedding in felsics (visible locally). Very slight magnetic as a result of trace magnetite content. Massive; no fractures or faults visible. Upper and lower contacts gradational over 5cm.</p>					

METRES		DESCRIPTION	CORE SAMPLES			
FROM	TO		FROM	TO	WIDTH	Samp Gold (ppb)
40.8	57.9	<p><u>BANDED IRON FORMATION - OXIDE FACIES</u> Colour: interbanded black and light grey Hardness: 6 to 7 Composition: highly variable between beds; overall, 70% quartz; 15% magnetite; 10% mafics (chlorite, amphibole); and to 5% sulphides (pyrrhotite and pyrite, trace chalcopyrite). Unit consists of interbedded quartz (cherty) beds, magnetite-rich beds and mafic, amphibole-rich beds; minor sulphide beds locally (less than 1mm wide). Unit very fine-grained. Beds very regular and consistent; minor contortions (diagenetic) of bedding locally. Bedding oriented at 60° to the core axis. Unit magnetic throughout. At 40.8 to 42.0m, minor fractures (1mm wide) subparallel core axis and infilled with calcite; offset of bedding of 1-2mm along some fractures. Large quartz beds often contain similar fractures to those above, except infilled with sulphides. At 50.0m, fracture to 3mm wide containing pyrrhotite; oriented at 30° to the core axis. At 50.4 to 51.2m, bit polish seen on core; possible contaminant of sulphide analyses. At 50.9 to 51.3m, irregular blebs of pyrrhotite throughout zone; to 5% sulphides in this interval. At 53.7m, offset of 3mm in bedding across a microfault; pyrrhotite infilled along fault. At 56.8 to 57.6m, siliceous zone consisting of 70% quartz, 25% amphibole and 5% pyrrhotite; amphibole concentrated in irregular beds; pyrrhotite occurs as irregular blebs to 1cm across throughout zone; non-magnetic.</p>				
57.9	60.0	<p><u>TUFFACEOUS METASEDIMENT</u> Similar to interval 9.1 to 33.8m. Garnets to 5mm across seen locally. Distinct contacts above and below unit. Unit non-magnetic.</p>				
60.0	113.1	<p><u>BANDED IRON FORMATION - OXIDE FACIES</u> Similar to interval 40.8 to 57.9m. At 61.8 to 62.1m, pyrrhotite concentration to 15%; irregular bedding locally. At 62.2m, quartz-calcite veinlet (5mm wide) crosscutting bedding at 40° to the core axis; angular fragments of iron formation visible within veinlet. At 68.7m, pyrrhotite-rich beds (to 25%) over 10cm. At 69.9m, pyrrhotite-rich beds (to 25%) over 10cm. At 71.0m, bedding at 60° to core axis.</p>				

METRES		DESCRIPTION	CORE SAMPLES			
FROM	TO		FROM	TO	WIDTH	Gold (ppb)
		<p>At 71.7 to 72.5m, siliceous zone similar to interval 57.8 to 58.6m. At 73.3 to 74.1m, similar to interval 40.8 to 42.0m; numerous small tension-like fractures containing pyrrhotite. Sulphide-rich beds more common and wider at depth than near beginning of hole; resulting sulphide concentration can reach 10-15% over lengths of 5-10cm. At 79.9 to 80.3m, numerous quartz-calcite veinlets (to 3mm wide) subparallel core axis; fragments of host rock visible in larger veinlets; contortions and offsetting of bedding locally. At 80.5 to 80.8m, similar to interval 79.9 to 80.3m. At 85.7m, bedding at 65° to core axis. Bit polish on core intermittently between 85.8 to 89.0m. At 90.7m, pyrrhotite veinlet (2mm wide) at 40° to core axis; crosscuts bedding. At 91.9m, fracture at 30° to core axis; chlorite covers fracture surface. At 107.2m, 5cm band of metasediment; highly chloritized; 30% subhedral garnets (to 4mm across). At 108.9 5cm bed consisting of approximately 60% pyrrhotite. At 110.7 similar to 108.9m. At 111.5m, similar to 108.9m. At 112.6 to 113.1m, sulphide-rich zone; to 40% sulphides (pyrrhotite and minor pyrite); massive fine-grained sulphides locally with rounded fragments of iron formation contained; bedding contorted to destroyed locally by sulphide concentrations. Lowermost 7 to 8 metres of unit shows more contorted, irregular and discontinuous bedding than above. Lower contact sharp; oriented at 65° to core axis. Unit massive overall.</p>				
113.1	137.4	<p>VOLCANIC TUFF</p> <p>Colour: light to medium green overall; interbanded green and light green to off-white on smaller scale.</p> <p>Hardness: 2 to 7</p> <p>Texture: alignment of mafic minerals gives foliation parallel bedding; oriented to 60° to 65° to core axis.</p> <p>Composition: 50-60% amphibole; 25% quartz/felsics; 10% biotite; 5% chlorite; and trace sulphides.</p> <p>Unit consists of interbanded mafic-rich (amphibole or mica) and felsic-rich (predominantly quartz) beds. Beds range in thickness but predominantly 3 to 5mm in width. Unit non-magnetic throughout. Few sulphides disseminated through unit; approximately 80% pyrrhotite, 20% pyrite, with trace chalcopyrite locally.</p>

FROM	TO		FROM	TO	WIDTH	Samp	Gold (ppb)
0.0	3.6	OVERBURDEN					
3.6	93.8	VOLCANIC TUFF Colour: light to medium green overall; variable between alternate beds. Hardness: 3 to 7 Texture: overall, crystal alignment (micas, amphiboles) gives foliation direction parallel bedding. Such foliation not visible over short intervals due to intergrown nature of amphibole clusters, e c. Composition: highly variable between individual beds, but overall unit consists of approximately 40% amphibole; 30% felsics (predominantly quartz, plus feldspars); 20% mica (biotite); 10-15% chlorite; and 2-5% sulphides. Relict bedding oriented at 60° to core axis. Bedding seen through alternating mafic-rich/felsic-rich beds and/or mica-rich beds in mafic intervals. Overall, unit is fine-grained with amphibole crystals to 3mm locally. Bedding is distinct; beds are largely 1-2mm in width, occasionally to 5mm in width. Felsic-rich intervals in the unit likely gradational to tuffaceous metasediments. Sulphides consist mainly of pyrrhotite (80%+) with occasional pyrite and trace chalcopyrite locally; occurs as disseminated blebs throughout unit. Unit slightly magnetic locally due to pyrrhotite content. At 3.6-6.1m, coarser-grained, amphibole-rich interval; little bedding visible. At 6.5-7.7m, similar to interval 3.6-6.1. At 11.90-12.05m, broken core; quartz fragments at 12.05m, likely quartz vein. At 13.9m, quartz bed to 5cm wide; minor deflections of bedding to 2cm on either side. At 14.0-14.6 broken core; "sand seam" reported by drill crew; minor	3.0	12.2	9.2	13187	10 (sludge)

METRES		DESCRIPTION	CORE SAMPLES				
FROM	TO		FROM	TO	WIDTH	Samp	Gold (ppb)
		(less than 1mm) vugs visible along fractures and bedding planes - possible fault zone; no microfaults or bedding offset seen in core; only minor fracturing visible. At 15.6m, minor fractures crosscutting bedding; oriented at 40° to core axis. At 19.9m, a 5cm wide quartz vein near perpendicular to core axis. At 25.2m, bedding at 60° to the core axis. Below approximately 32.7m, sulphide content increases to 5% overall and to 10% in beds to 3mm wide; sulphides concentrated in felsic-rich beds and disseminated throughout unit; chalcopyrite visible locally; 85-90% pyrrhotite; trace magnetite possible due to magnetic response from these zones; gradational contact relative to sulphide-poor zone above. At 36.1m, beds of crystalline calcite over 5cm. At 39.7-42.2m, sulphide zone; sulphides consist of 75% pyrrhotite, 20-23% pyrite and 2% chalcopyrite locally; occurs both as disseminations and interbedded within volcanic tuff sequence; sulphides make up 10% by volume through zone, to 40% locally (40.7-49.8m, 40.9-40.95m) bedding regular except in above two short intervals; here, bedding is destroyed; unit consists of tuffaceous fragments in sulphide matrix; gradational with rock both above and below. At 44.0m, quartz vein (3cm wide) near perpendicular core axis. At 44.8m, quartz vein (1cm wide) at 70° to core axis. At 46.1m, crystalline calcite bed (5mm across). Trace chalcopyrite throughout tuff. Unit very uniform below sulphide zone; fine-grained, evenly bedded; only minor fracturing. Occasional calcite beds throughout. At 58.6m, bedding at 60° to core axis. At 60.1m, minor offsets of bedding over 3cm. At 62.6m, 2mm calcite veinlets at 25° to core axis. At 79.2m, bedding at 70° to core axis. At 84.1m, calcite veinlet at 20° to core axis. At 91.8m, fracture near-parallel core axis. At 92.5m, bedding at 70° to core axis.	15.6	18.6	3.0	1295A	NIL

CERTIFICATE

I, Gary Williams, of the City of Gloucester in the Province of Ontario, do hereby certify that:

1. I reside at 2096 Orient Park Drive, Gloucester, Ontario, K1B 4V9.
2. I hold an Honours Bachelor of Science degree from the University of Western Ontario, in London, Ontario.
3. The diamond drill program herein reported was completed under my supervision, and I was present while it was being carried out. I have supervised the preparation of the maps and have written the report.

DATED at Ottawa this 6th day of July, 1983.

Dear Sir:

RE: Assaying submitted under Section 77(19) of The Mining Act RSO 1930, on mining claims PA 487909 et al in the Areas of North Caribou/Ericksen Lake

Please disregard my Notice of Intent dated September 7, 1983.

The enclosed statement of assessment work credits for assaying expenditures has been approved as of the above date.

Please inform the recorded holder of these mining claims and so indicate on your records.

Yours very truly,

Dear Sir:

We have received data for Assaying submitted under Section 77(19) of the Mining Act R.S.O. for Mining Claims PA 487909 et al in the Areas of North Caribou/ Erichsen Lake.

This material will be examined and assessed and a statement of assessment work credits will be issued.

We do not have a copy of the report of work which is normally filed by you prior to the submission of this technical data. Please forward a copy as soon as possible.

Yours very truly,

E.F. Anderson

Attention: Mr. Fred Matthews
Supervisor, Project Unit

Dear Sir:

Re: Unpatented Mining Claims PA 487909, et al, Patricia
Mining Division, North Caribou/Ericksen Lakes Area

In accordance with a telephone conversation with Mr. Ray Pichette at your offices, please find enclosed, in duplicate, the following information for assessment credit:

1. Drill logs showing geochem. intervals;
2. Analytical results from the lab;
3. Proof of payment for geochem. work;
4. Location map showing drill holes with respect to claim boundaries; and
5. Certificate signed by the Project Geologist.

I trust that this information is sufficient, however, if there are any questions, please do not hesitate to contact our offices.

Yours truly,

R. J. McH Clark
District Manager

Dear Sir:

Enclosed are two copies of a Notice of Intent with statements listing a reduced rate of assessment work credits to be allowed for a technical survey. Please forward one copy to the recorded holder of the claims and retain the other. In approximately fifteen days from the above date, a final letter of approval of these credits will be sent to you. On receipt of the approval letter, you may then change the work entries on the claim record sheets.

For further information, if required, please contact Mr. F.W. Matthews at 416/365-1380.

Notice of Intent
for Technical Reports

1983 09 07

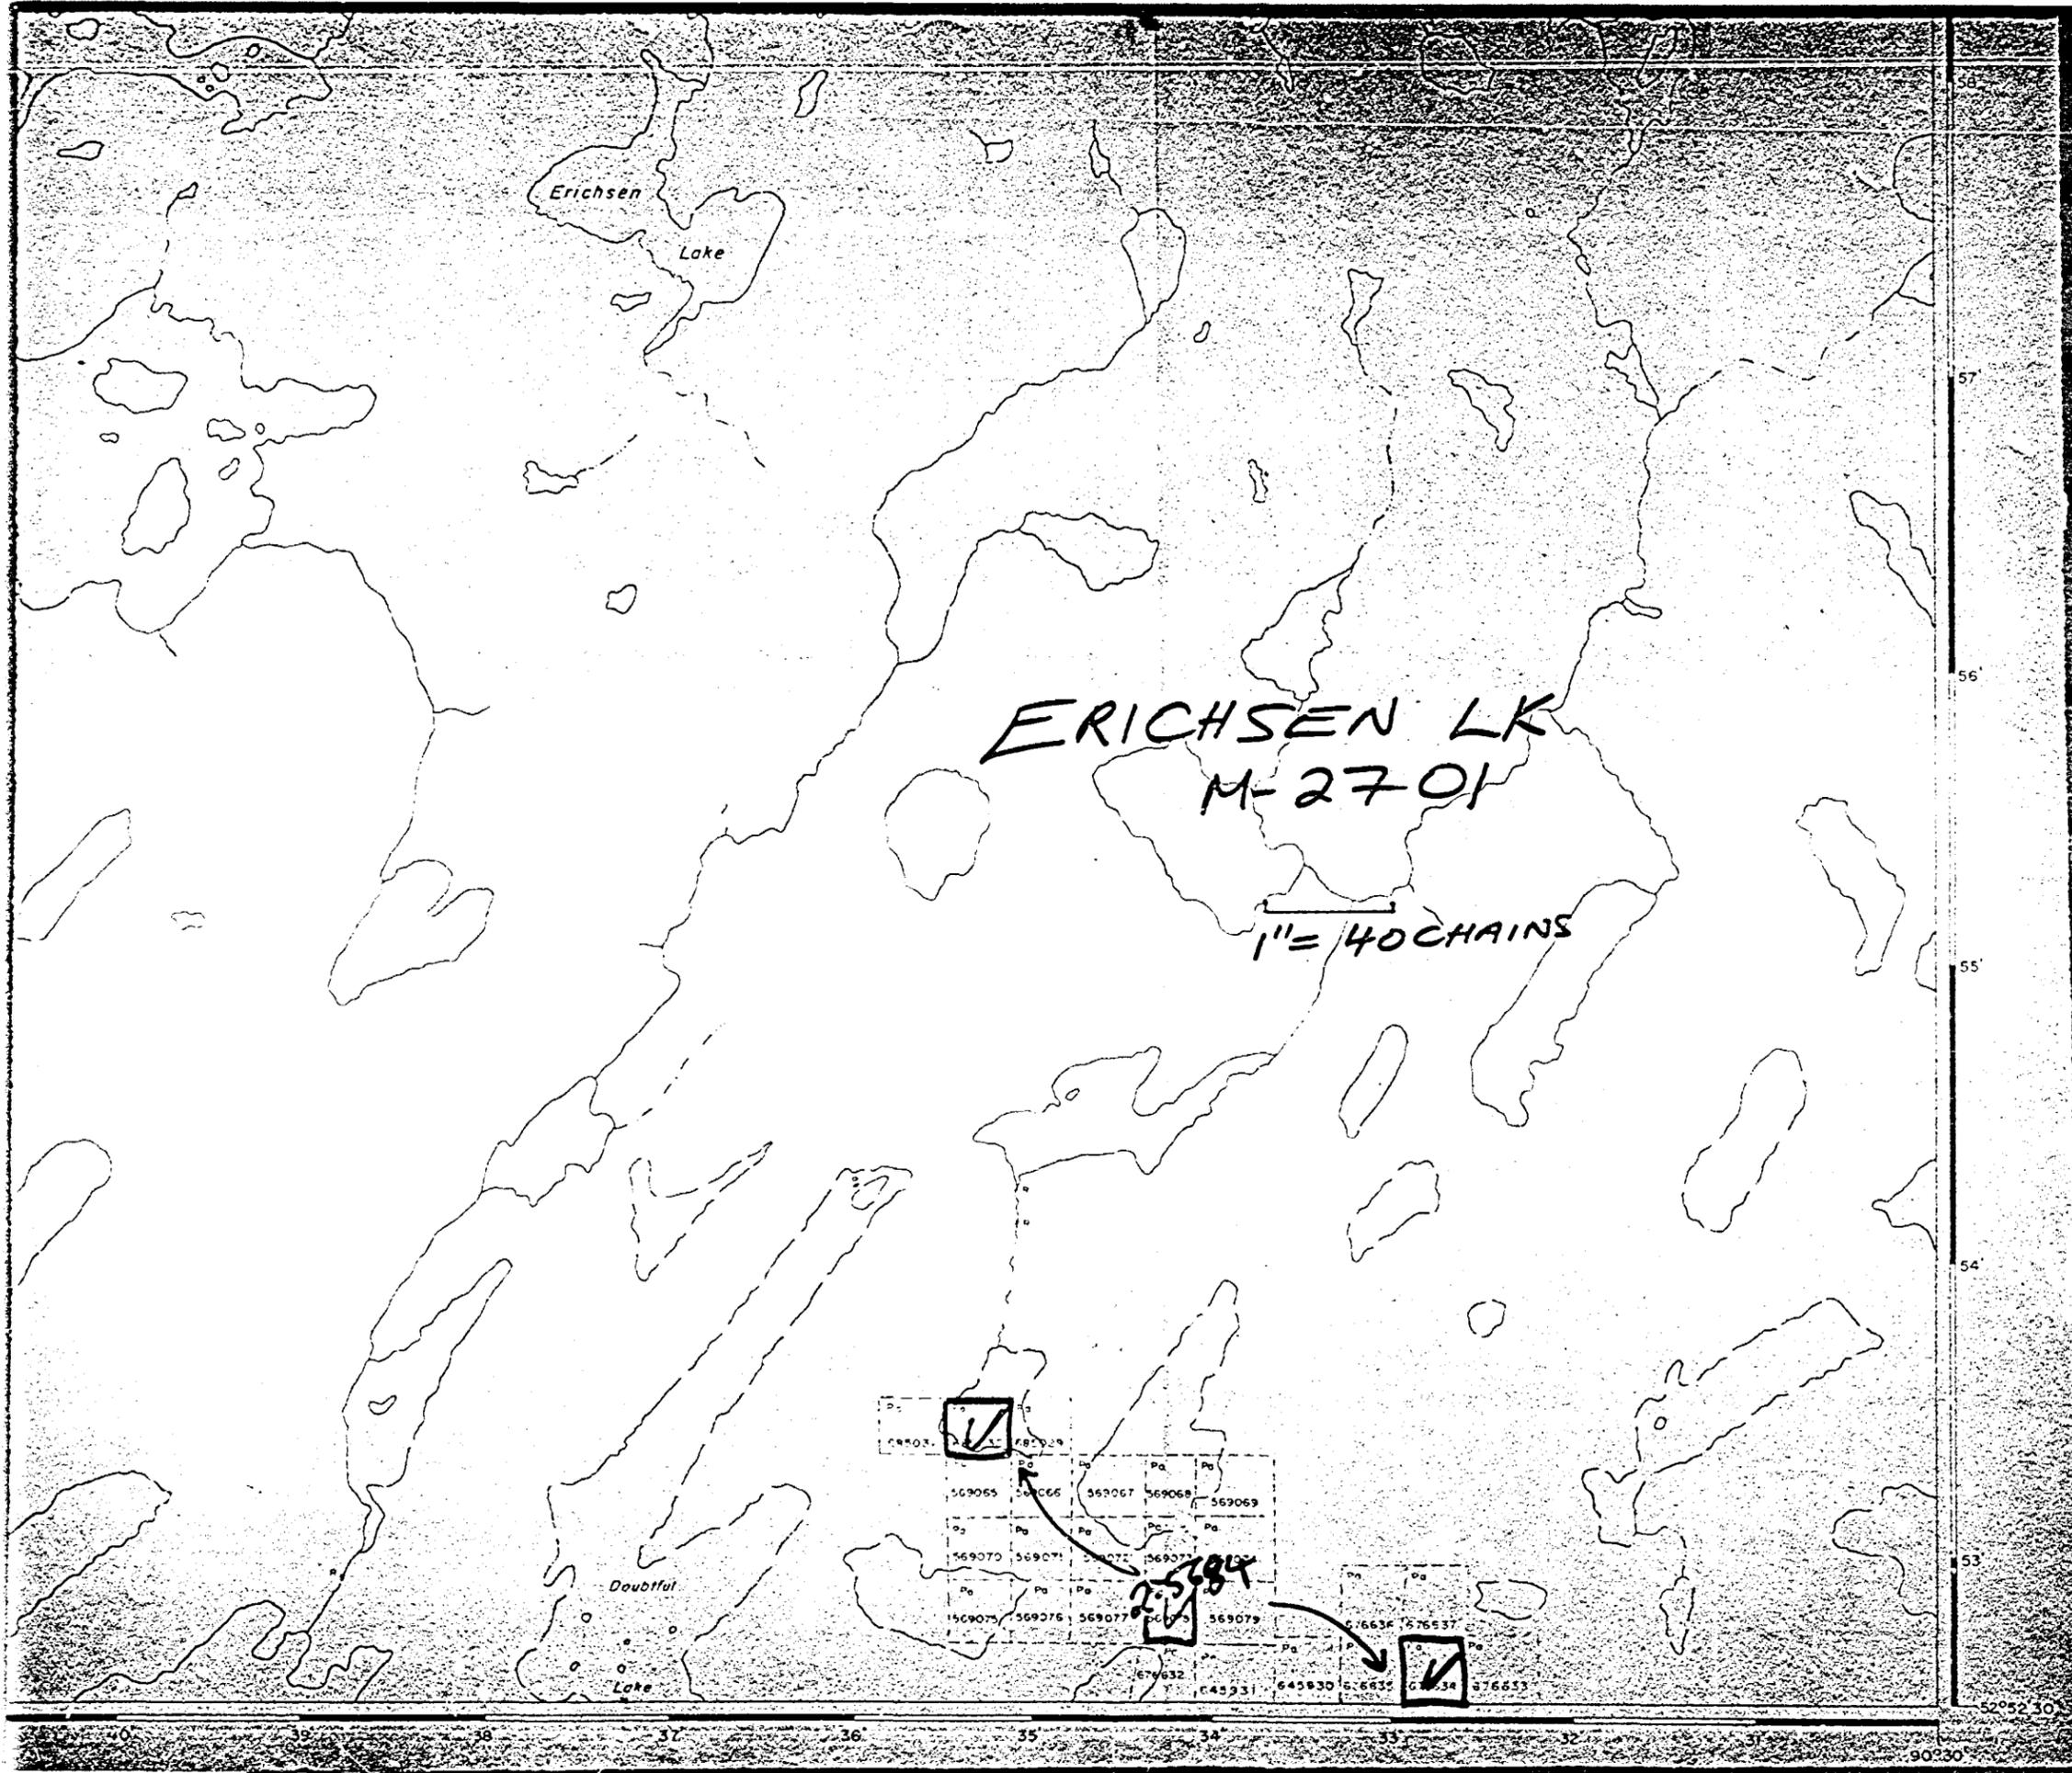

2.5684/83-65

An examination of your survey report indicates that the requirements of The Ontario Mining Act have not been fully met to warrant maximum assessment work credits. This notice is merely a warning that you will not be allowed the number of assessment work days credits that you expected and also that in approximately 15 days from the above date, the mining recorder will be authorized to change the entries on his record sheets to agree with the enclosed statement. Please note that until such time as the recorder actually changes the entry on the record sheet, the status of the claim remains unchanged.

If you are of the opinion that these changes by the mining recorder will jeopardize your claims, you may during the next fifteen days apply to the Mining and Lands Commissioner for an extension of time. Abstracts should be sent with your application.

If the reduced rate of credits does not jeopardize the status of the claims then you need not seek relief from the Mining and Lands Commissioner and this Notice of Intent may be disregarded.

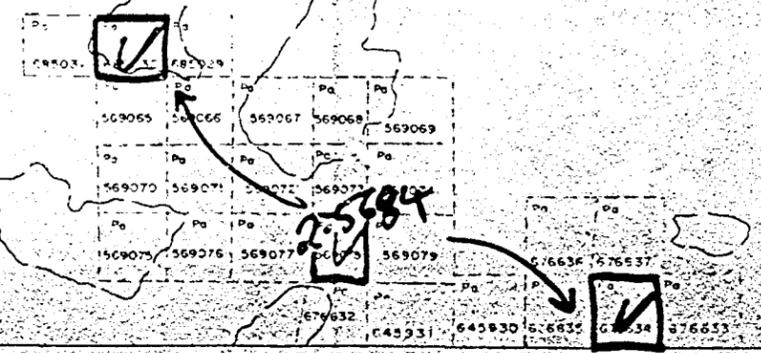

If your survey was submitted and assessed under the "Special Provision-Performance and Coverage" method and you are of the opinion that a re-appraisal under the "Man-days" method would result in the approval of a greater number of days credit per claim, you may, within the said fifteen day period, submit assessment work breakdowns listing the employees names, addresses and the dates and hours they worked. The new work breakdowns should be submitted direct to the Lands Management Branch, Toronto. The report will be re-assessed and a new statement of credits based on actual days worked will be issued.
