Introduction

This report is intended to provide a snapshot of the currently available Mineral Deposit Inventory (MDI) record of mineral occurrences, prospects and past and producing mines in the region of northern Ontario, north of latitude 49° 30'. The table in this report comprises the most recent listing of MDI sites from the Ontario Geological Survey's (OGS) MDI database on GeologyOntario (<http://www.geologyontario.mndm.gov.on.ca/>), with critical additional information on each site, including location (in Universal Transverse Mercator (UTM) co-ordinates), MDI number for easy referral back to the MDI database, associated commodities and deposit name. The accompanying map (Figure 1, back pocket) and insets (Chart A, back pocket) show the locations of all sites listed in the table, on an updated regional geology base with a reconstructed topographic background. The map and insets illustrate the relative distribution of various mineral occurrences in relation to general Precambrian bedrock geology across this part of Ontario. The Precambrian geology underlying the James Bay and Hudson Bay lowlands has been interpreted from aeromagnetic maps and limited diamond-drill hole data. The locations of communities and parks across the region are also shown on the map and insets. Together, the listing of MDI sites and the accompanying map and insets should assist in regional land-use planning and predictive modelling of potential mineral occurrences.

This report and its accompanying back pocket material are meant to be used in conjunction with the raw data, comprising ESRI ArcMap[®] files, provided on Miscellaneous Release—Data 265 (MRD 265), a complementary publication to this report, available separately.

Sources of Information and Credits

The geology on the accompanying map and insets is mainly derived—with some revisions—from various OGS publications, including OGS 2006, Stott 2008a, 2008b and 2009, and Stott and Josey 2009, with additional, updated geology from more recently published OGS maps (see complete list of references on MRD 265). The topographic base, with the exception of the lakes and rivers, is the Ministry of Natural Resources' Land Information Ontario (LIO) / Natural Resource Values Information System (NRVIS) base map. The rivers were digitized from LandSat images and the lakes are a combination of LIO / NRVIS, LandSat images, and Natural Resources Canada. The projection is Lambert Conic Conformal.

Ann Wilson, Resident Geologist's Office, Timmins, provided additional, new and updated information on mineral occurrences in the McFaulds Lake region for the MDI listing.

The geological interpretation was carried out by G.M. Stott and S.D. Josey during 2008 and 2009. The base map and digital cartography were prepared by S.D. Josey.

Abbreviations and Explanations

Below are explanations of the mineral deposit classifications (“Commodity Type” column) and commodity abbreviations (“Commodity” column) used in the listing of mineral deposits. All are from the MDI2 database (OGS 2004).

MINERAL DEPOSIT CLASSIFICATION

Producing Mine

Commodities are currently being extracted for sale. Total of the produced ore plus the published, defined reserves meet the minimum standards outlined in MDI2.

Past Producing Mine With Reserves

Commodities were in the past extracted for sale. Past production and reserves of the unmined material meet the minimum standards outlined in MDI2.

Past Producing Mine Without Reserves

Commodities were in the past extracted for sale. Production met the minimum standards outlined in MDI2. No reserves remain or the existing reserves do not meet the minimum standards outlined in MDI2.

Developed Prospect With Reserves

Mineralization is present in three dimensions as outlined by a delineation diamond drill program. Mineralization occurs for significant distances along strike and down-dip, with numerous intersections that meet the minimum standards outlined in MDI2. Reserves meet the minimum grade/tonnage standards outlined in MDI2.

Developed Prospect Without Reserves

Mineralization is present in three dimensions as outlined by a delineation diamond drill program. Mineralization occurs for significant distances along strike and down-dip, with numerous intersections that meet the minimum standards outlined in MDI2. Reserve figures have not been published or the published reserves do not meet the minimum standards outlined in MDI2.

Prospect

Mineralization is present in three dimensions as indicated by diamond drill hole intersections +/- surface rock sampling. Mineralization extends for significant distances along strike and down-dip with a minimum of three mineralized intersections that meet the minimum grade/width standards outlined in MDI2.

Occurrence

Mineralization is present in two dimensions as indicated by surface rock (channel or grab) sampling and/or isolated diamond drill hole intersection(s). At least one sample meets the minimum grade requirements outlined in MDI2.
